SUMMARY

Data Scientist specializing in **tabular ML and causal inference** / **econometrics** for fintech, who ships models to production at scale. Built and productionized a clustering pipeline over **120M+ customer profiles** on PySpark and deployed boosting and econometric NPV/LTV models that drive product-pricing decisions in a top-3 national bank, with monitoring and retraining. Strong mathematical foundation — MSc in Computational Mathematics, Lomonosov Moscow State University.

EDUCATION

Lomonosov Moscow State University (Master's degree) September 2024 - June 2026

Faculty of Computational Mathematics and Cybernetics (*GPA*: 4.4/5). Thesis: dynamic credit-portfolio management — Merton PD, econometric forecasting, portfolio optimization, backtesting ([GitHub](#)).

Lomonosov Moscow State University (Bachelor's degree) September 2020 - June 2024

Faculty of Computational Mathematics and Cybernetics (*GPA*: 4.3/5).

WORK EXPERIENCE

Sber (top-3 bank by assets, 100M+ customers) May 2024 - Present

Data Scientist, Investment Expertise Directorate (Finance Division)

- Built and productionized a PySpark clustering pipeline segmenting **120M+ customer profiles** on a Hadoop cluster, replacing manual segmentation; it refreshes on schedule with no manual intervention.
- Shipped gradient-boosting and econometric **NPV/LTV models** to production — raising estimation accuracy by **15%** — that now drive product-pricing and investment decisions; designed the monitoring, retraining, and business-acceptance process so stakeholders rely on the outputs directly.
- Designed and piloted a new LTV-based product-economics metric for the directorate, defining it from scratch and validating it with statistical experiments and A/B testing before adoption.
- Stack: Python (PySpark, Pandas, Scikit-learn, PyTorch), SQL, Hive, Git.

Sber August 2023 - March 2024

Data Science Intern, Balance Sheet Structure Department (Finance Division)

- Integrated a pre-trained ML model into the production pipeline, lifting target-prediction quality by **30%** on validation while keeping inference reproducible.
- Cut the core computation's runtime **3×** and reduced its memory footprint via profiling-driven algorithmic refactoring and vectorization.
- Built automated PySpark ETL workflows over HDFS (extraction, validation, preprocessing) with logging and error handling, replacing fragile manual prototypes and reducing onboarding time through tests and documentation.
- Stack: Python (PySpark, Pandas, Scikit-learn), SQL, Hive.

SKILLS

Languages:	Python, SQL, C/C++
ML & Data:	PySpark, Scikit-learn, PyTorch, Pandas, NumPy, SciPy, Hive, Hadoop
Tabular ML:	Gradient boosting, feature engineering, validation & calibration, clustering
Causal & stats:	Causal inference, A/B testing, econometrics, time-series
Production:	End-to-end pipelines, model deployment, monitoring & retraining, Git

PROFESSIONAL DEVELOPMENT

- *Methods of Data Analysis and Machine Learning* — Sber University [Certificate](#)
- *Spark Advance* — Sber University [Certificate](#)
- *System Design* — Sber University [Certificate](#)
